IBM Bluemix Delivery Pipeline

Except as noted below, the terms of the IBM Bluemix Service Description or Terms of Use, as applicable, apply. The following is the Service Description for the Cloud Service:

1. **Cloud Service Description**
   The IBM Bluemix Delivery Pipeline service consists of two distinct capabilities: Continuous Integration and Continuous Delivery Pipeline
   a. **Continuous Integration**
      Continuous Integration allows you to automate builds and test execution by configuring build engines to compile source from code repositories; configure build scripts; and automate execution of unit tests. A build engine can be configured to trigger a build automatically upon delivery of each change to the code repository. For a given build you can view build logs; view changes included in a build; download build artifacts; and view results of test execution.
   b. **Continuous Delivery Pipeline**
      Continuous Delivery Pipeline allows for automated deployment of an application to a runtime platform, such as IBM Bluemix. You can configure deployment of an application to one or more runtime instances for development, test, staging and production environments, as well as orchestrate promotion across these environments. Deployment options for the application can be configured such that successful completion of a build in the Continuous Integration service triggers automatic deployment of the application.

2. **Entitlement and Billing Information**
   There is no charge for the use of this Cloud Service.

3. **Safe Harbor Framework**
   The Cloud Service does not comply with the US-EU and US-Swiss Safe Harbor Frameworks.
