Notes:

Performance is in Internal Throughput Rate (ITR) ratio based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput that any user will experience will vary depending upon considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve throughput improvements equivalent to the performance ratios stated here.

IBM hardware products are manufactured from new parts, or new and serviceable used parts. Regardless, our warranty terms apply.

All customer examples cited or described in this presentation are presented as illustrations of the manner in which some customers have used IBM products and the results they may have achieved. Actual environmental costs and performance characteristics will vary depending on individual customer configurations and conditions.

This publication was produced in the United States. IBM may not offer the products, services or features discussed in this document in other countries, and the information may be subject to change without notice. Consult your local IBM business contact for information on the product or services available in your area.

All statements regarding IBM's future direction and intent are subject to change or withdrawal without notice, and represent goals and objectives only.

Information about non-IBM products is obtained from the manufacturers of those products or their published announcements. IBM has not tested those products and cannot confirm the performance, compatibility, or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

Prices subject to change without notice. Contact your IBM representative or Business Partner for the most current pricing in your geography.

This presentation and the claims outlined in it were reviewed for compliance with US law. Adaptations of these claims for use in other geographies must be reviewed by the local country counsel for compliance with local laws.

Disclaimer

The information in this document has not been submitted to any formal IBM test and is distributed on an "as is" basis without any warranty expressed or implied. Use of this information or the implementation of any of these techniques is a user responsibility and depends on the user's ability to evaluate and integrate them into the user's operational environment. While each item may have been reviewed for accuracy in a specific situation there is no guarantee the same or similar results may be achieved elsewhere. Users attempting to adapt these techniques to their environments do so at their own risk.

Agenda

- A zIIP overview
- What are the tuning options
- RMF updated reports
- Measurements
 - Run objectives
 - Results
- Summary
- Questions

A zIIP Overview

- New specialty engine for the System z9 mainframe designed to help:
 - **Customers integrate data across the enterprise**
 - **Improve resource optimization and lower the cost of ownership for eligible data serving workloads**
- z/OS manages and directs work between the general purpose processor and the zIIP
 - **No changes anticipated to DB2 for z/OS V8 applications**
 - **Number of zIIPs per z9 not to exceed number of standard processors**
- DB2 for z/OS V8 will be first exploiter of the zIIP with:
 - **System z9**
 - **z/OS 1.6 or later**
 - **DB2 for z/OS V8**
 - **Software GA 6/30/06**

DB2 Eligible Workloads

- ERP, CRM and multi tier application serving*
 - For applications, running on z/OS, UNIX, Linux, Intel, or Linux on System z, that access DB2 for z/OS V8 on a System z9, via DRDA over a TCP/IP connection DB2 gives z/OS the necessary information to have portions of these SQL requests directed to the zIIP
- Data warehousing applications*
 - Requests that utilize DB2 for z/OS V8 star schema parallel queries may have portions of these SQL requests directed to the zIIP when DB2 gives z/OS the necessary information.
 - This function has been enhanced to include all parallel queries
- Some DB2 for z/OS V8 utilities*
 - A portion of DB2 utility functions used to maintain index maintenance structures (example LOAD, REORG, and REBUILD INDEX) typically run during batch, can be redirected to zIIP.

* The zIIP is designed so a program can work with z/OS to have a portion of it's Service Request Block (SRB) enclave work directed to the zIIP. The above types of DB2 V8 work are those executing in SRB enclaves, portions of which can be sent to the zIIP.

What are SRB Enclaves

- z/OS dispatches work in either TCB (Task Control Block) mode or SRB (Supervisor Request Block) mode. DB2 parallel tasks use SRB mode and are assigned the same importance as the originating address space.
- Preemptable enclaves are used to do the work on behalf of the originating TCB or SRB address space. Enclaves are grouped by common characteristics and service requests and since they are preemptable, the z/OS dispatcher (and WLM) can interrupt these tasks for more important ones (i.e. manage a transaction end-to-end). There are two types of preemptable SRBs: client SRBs and enclave SRBs.
- If the DB2 for z/OS V8 request is coming in over distributed (i.e. DRDA over TCP/IP) then most of the work is executed in enclave SRBs.
- If the request is coming over local / native connection, then the work is dispatched between TCBs, client SRBs, and enclave SRBs (star schema parallel queries and some utility index maintenance now use enclave SRBs)

So..... regarding the zIIP, only the enclave SRB work (not the client SRB work or non-preemptable SRB work or TCB work) is eligible to be redirected to the zIIP. DB2 V8 knows how its work is dispatched and directs z/OS 1.6 or later to dispatch (redirect) a portion of the eligible work to the zIIP.

DRDA Example

Enterprise Applications that access DB2 for z/OS V8 via DRDA over a TCP/IP connection will have portions of these SQL requests directed to the zIIP

For illustrative purposes only
Actual workload redirects may vary

DB2 V8 zIIP re-direct enabling APAR:
PK18454 for DRDA - Available

DB2 Utilities

- Only portions of DB2 utility (LOAD, REORG, & REBUILD) processing related to index maintenance
 - Amount of work eligible to re-direct onto a zIIP, depends on:
 - How many indexes are defined on the table
 - How many partitions are in the table
 - If data compression is being used
 - And possibly other factors
 - Less re-direct is expected with:
 - Tables with fewer indexes
 - Fewer partitions
 - Compression used
 - More re-direct is expected with:
 - Tables with many indexes or many partitions
- DB2 V8 zIIP re-direct enabling APAR :
 - PK19920 for Utilities
 - Available

Star Schema

- Only Star Schema query parallel processing
 - A portion of the child task processing is eligible for re-direct to a zIIP
 - Main tasks coming in via DRDA via TCP/IP can take advantage of the DRDA use of zIIP.
- The combined child & main tasks coming in through DRDA via TCP/IP can increase the amount of processing eligible for zIIP.
- Longer running queries see higher benefit.
- DB2 V8 zIIP re-direct enabling APAR :
 - PK19921 for Star Schema
 - Available
 - PK27578 for more function
 - zIIP exploitation for all CP parallel queries
 - Available

What are the Tuning Options

- There are no external tuning options
- Different from the zAAP implementation
 - IFACROSSOVER
 - IFAHONORPRIORITY
- Internal tuning options
 - zIIP Crossover = NO
 - zIIP Honorpriority = YES
 - Needs help dispatcher
 - General purpose CPs only help if zIIP asks for help

Measurements

Environment - DRDA

DRDA Runs

- 4 GP CPs with 0 zIIPs to build the baseline
 - Identify zIIP eligible work using the RMF Post Processor Report
 - Validate workload can drive more than 1 zIIP
- 4 GP CPs with 1 zIIP
 - Validate work moved to the zIIP
 - IIP field on the RMF Workload Activity Report
 - Reduce utilization of the GP CPs
 - More work than 1 zIIP can handle
 - zIIP should 'ask for help'
 - IIPCP field on the RMF Workload Activity Report
- 4 GP CPs with 2 zIIPs
 - Validate more work is running on the zIIPs
 - Increase on IIP field on the RMF Workload Activity Report
 - Reduced IIPCP field on the RMF Workload Activity Report
 - Reduce utilization of the GP CPs
 - Less 'Needs Help' for zIIPs

DRDA Run # 1

Utilities use dependent enclave SRBs versus independent enclaves.

Work continues in same period and service class. Not additional WLM classification required

Job elapsed time

Total CPU time in seconds

$$\text{IIPCP Time} = 164.9 / 6888 * .3922 = 94 \text{ seconds}$$

- Appears less than 1 zIIP should be needed for this workload

Reorg Utility Run # 2

1 zIIP

 - Function of database characteristics
 - 8 indexes, 20 partitions
- Your mileage may vary

Reorg Summary

Reorg zIIP Measurements

Summary

- The zIIP is a cost effective engine to support DB2 workloads on zSeries
 - Should allow zSeries to compete for workloads not considered in the past
- ProjectCPU provides accurate estimates for potential to redirect work to the zIIP
 - Requires z/OS v1.6 or higher and DB2 V8 plus zIIP PTFs
- No external tuning options reduces complexity of implementation
- Biggest inhibitor to exploitation is running a level of DB2 prior to V8
